

Day 1 : AI Automation Taks

5 Real World Business That Needs Automation

1. AI-Powered Accounts Payable (Invoice Routing)

- **Current Manual Process:** The finance team receives PDF invoices via email, manually opens them, reads the total amounts and vendor names, types the data into an accounting system, and forwards the email to department heads for approval.
- **Problem:** High risk of typing errors, slow payment cycles causing late fees, and highly repetitive data entry draining the finance team's time.
- **Trigger:** A new email arrives in the billing@company.com inbox containing a PDF attachment.
- **Input:** Email sender address, PDF attachment file.
- **Processing Required:** Use AI/OCR to extract the Vendor Name, Total Amount, and Due Date from the PDF. Use branching logic to determine which department head needs to approve it based on the vendor or amount.
- **Expected Output:** A drafted entry in the accounting database and an automated message sent to the specific manager's Slack/email with an "Approve/Reject" button.
- **Benefits of Automation:** Eliminates human data entry errors, speeds up vendor payments, and saves hundreds of hours of manual accounting work.

2. Zero-Trust Employee Offboarding (IT Security)

- **Current Manual Process:** When an employee resigns, HR sends an email to IT. An IT admin must manually log into Google Workspace, Slack, the CRM, GitHub, and internal databases one by one to delete or suspend the user's accounts.
- **Problem:** If the IT admin forgets even one system, a former employee retains access to sensitive company data, creating a massive cybersecurity risk. It is also a tedious checklist for IT.
- **Trigger:** HR changes an employee's status to "Terminated" in the HR management software (Triggered via Webhook).
- **Input:** Employee Name, Corporate Email Address, Termination Date.
- **Processing Required:** Validate the employee ID. Loop through various company SaaS APIs (Slack, Google, GitHub) to find matching active accounts for that email.

- **Expected Output:** API calls automatically suspend the user across all platforms simultaneously. A final confirmation log is emailed to HR and IT security.
- **Benefits of Automation:** Ensures 100% security compliance instantly, mitigates data breach risks, and removes manual IT checklist work.

3. App Store Bug Triage & Jira Ticket Creation (QA/Product)

- **Current Manual Process:** A product manager reads daily App Store and Google Play Store reviews, manually spots users complaining about app crashes, and manually copies those reviews into Jira tickets for the development team.
- **Problem:** Real software bugs are buried under thousands of generic reviews. Developers get notified late, leading to prolonged app crashes and lost revenue.
- **Trigger:** A scheduled daily trigger (e.g., 8:00 AM) that fetches new app reviews via API.
- **Input:** Review text, Star rating, Device OS, User ID.
- **Processing Required:** Use an LLM to analyze the sentiment and intent of the review. Filter out generic praise or complaints. If the intent is classified as a "Technical Bug," extract the described issue.
- **Expected Output:** Automatically generate a structured Jira ticket for the engineering team containing the bug details, and send an automated "We are looking into this" reply to the user.
- **Benefits of Automation:** Drastically reduces bug response times, provides developers with organized data, and saves product managers from reading thousands of irrelevant reviews.

4. VIP Lead Enrichment & Routing (Sales/Marketing)

- **Current Manual Process:** After a marketing webinar, the team downloads a CSV of 500 attendees, manually Googles their company names to see how big they are, and manually assigns the biggest companies to senior sales representatives.
- **Problem:** High-value leads go cold because it takes days to manually research 500 companies.
- **Trigger:** A new user registers or attends a Zoom webinar (Webhook trigger).
- **Input:** Attendee Name, Email, Company Name.
- **Processing Required:** Call a data enrichment API (like Clearbit or Apollo) to find the company's employee count and annual revenue. Use an IF node to check if the revenue is

> \$10M

- **Expected Output:** If the company is massive, immediately send an urgent Slack/Telegram alert to the Enterprise Sales team with the enriched data. If small, add them to a standard automated email nurture sequence.
- **Benefits of Automation:** Strikes while the iron is hot—Enterprise sales reps can contact high-value targets within minutes of the webinar ending, requiring zero manual marketing research.

5. Predictive Inventory Reorder Alerting (Supply Chain)

- **Current Manual Process:** A warehouse manager walks the floor or checks a massive Excel sheet weekly to see what stock is running low, then manually drafts emails to different suppliers asking for quotes.
 - **Problem:** Prone to human forgetfulness, resulting in stockouts (running out of products to sell) or delays in supplier communication.
 - **Trigger:** Database Webhook (Fires anytime a product's inventory quantity drops below a defined minimum threshold).
 - **Input:** Item ID, Current Quantity, Supplier Email, Item Name.
 - **Processing Required:** Calculate how much stock is needed to reach maximum capacity. Use AI to draft a polite, customized quote-request email to the specific supplier for that item.
 - **Expected Output:** An automated email is sent to the supplier requesting the exact missing quantity, and a log is updated in the warehouse management system.
 - **Benefits of Automation:** Completely prevents out-of-stock scenarios, maintains optimal cash flow (no over-ordering), and automates entire supply chain communications.
